# Goal of model evaluation

---

- **Model assessment and selection**

- Measures of predictive accuracy
- Model selection

- **Cross-validation**

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- **Information criteria**

- **Model averaging and Stacking**

- **Summary**

- Model choice is a (model-)decision-theoretic problem

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

- Model choice is a (model-)decision-theoretic problem
- Evaluate the **utility** of a model  $M$  for new **unseen data**  $\tilde{y}$ :

$$U = \int u(\tilde{y}) p_{\text{true}}(\tilde{y}) d\tilde{y},$$

where  $\tilde{y}$  is an unseen observation generated from the true data generating process  $p_{\text{true}}(\tilde{y})$ , and  $y$  are observed data and  $u(\tilde{y})$  is a utility function.

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

- Model choice is a (model-)decision-theoretic problem
- Evaluate the **utility** of a model  $M$  for new **unseen data**  $\tilde{y}$ :

$$U = \int u(\tilde{y}) p_{\text{true}}(\tilde{y}) d\tilde{y},$$

where  $\tilde{y}$  is an unseen observation generated from the true data generating process  $p_{\text{true}}(\tilde{y})$ , and  $y$  are observed data and  $u(\tilde{y})$  is a utility function.

- The expectation is with respect to  $p_{\text{true}}$  ( $f$  in BDA3)

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

- Model choice is a (model-)decision-theoretic problem
- Evaluate the **utility** of a model  $M$  for new **unseen data**  $\tilde{y}$ :

$$U = \int u(\tilde{y}) p_{\text{true}}(\tilde{y}) d\tilde{y},$$

where  $\tilde{y}$  is an unseen observation generated from the true data generating process  $p_{\text{true}}(\tilde{y})$ , and  $y$  are observed data and  $u(\tilde{y})$  is a utility function.

- The expectation is with respect to  $p_{\text{true}}$  ( $f$  in BDA3)
- Choose the model function to **maximize our utility**

UPPSALA  
UNIVERSITET

# Model choice utility

---

- Application specific utility/cost functions are important
  - eg. money, life years, quality adjusted life years, etc.

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Application specific utility/cost functions are important
  - eg. money, life years, quality adjusted life years, etc.
- General utility: overall in the goodness of the predictive distribution
  - we don't know (yet) the application specific utility then good information theoretically justified choice is log-score for model  $M$

$$\log p_M(y^{\text{rep}}|y)$$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Application specific utility/cost functions are important
  - eg. money, life years, quality adjusted life years, etc.
- General utility: overall in the goodness of the predictive distribution
  - we don't know (yet) the application specific utility then good information theoretically justified choice is log-score for model  $M$

$$\log p_M(y^{\text{rep}}|y)$$

- We want the model that explain the data the "best"

## Subsection 1

### Measures of predictive accuracy

- Point residuals

$$e_i = y_i - E(\tilde{y}_i|y),$$

where

$$E(\tilde{y}|y) = \int \tilde{y} p(\tilde{y}|y) d\tilde{y},$$

i.e. the **expected predicted value**

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Point residuals

$$e_i = y_i - E(\tilde{y}_i|y),$$

where

$$E(\tilde{y}|y) = \int \tilde{y} p(\tilde{y}|y) d\tilde{y},$$

i.e. the **expected predicted value**

- Mean squared (prediction) error (MSE)

$$\text{MSE} = \frac{1}{n} \sum_i^n [y_i - E(\tilde{y}_i|y)]^2.$$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection

- Model averaging and Stacking
- Summary

# (Bayesian) Points Prediction Accuracy

- Point residuals

$$e_i = y_i - E(\tilde{y}_i|y),$$

where

$$E(\tilde{y}|y) = \int \tilde{y} p(\tilde{y}|y) d\tilde{y},$$

i.e. the **expected predicted value**

- Mean squared (prediction) error (MSE)

$$\text{MSE} = \frac{1}{n} \sum_i^n [y_i - E(\tilde{y}_i|y)]^2.$$

- But how do we evaluate the **posterior predictive distribution**?

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

- Scoring **rules**: *How well does the predictive distribution align with observation?*

$$S(F, y),$$

where  $S(F, y) \in \mathbb{R}$ ,  $F$  is a density, and  $y$  is an observation.

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Scoring **rules**: *How well does the predictive distribution align with observation?*

$$S(F, y),$$

where  $S(F, y) \in \mathbb{R}$ ,  $F$  is a density, and  $y$  is an observation.

- **Proper scoring rules**:  $S(F, y)$  is minimized when the forecasted distribution matches the (true) distribution of the observation

$$\mathbb{E}_{y \sim p_{true}} [S(p_{true}, y)] \leq \mathbb{E}_{y \sim p_{true}} [S(F, y)],$$

where  $p_{true}$  is the true data generating process.

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Scoring **rules**: *How well does the predictive distribution align with observation?*

$$S(F, y),$$

where  $S(F, y) \in \mathbb{R}$ ,  $F$  is a density, and  $y$  is an observation.

- **Proper scoring rules**:  $S(F, y)$  is minimized when the forecasted distribution matches the (true) distribution of the observation

$$\mathbb{E}_{y \sim p_{\text{true}}} [S(p_{\text{true}}, y)] \leq \mathbb{E}_{y \sim p_{\text{true}}} [S(F, y)],$$

where  $p_{\text{true}}$  is the true data generating process.

- **Local scoring rules**:  $S(p_{\text{true}}, y_i)$  only depend on the actual observation  $y_i$

- Model averaging and Stacking
- Summary

- The log score (a local and proper scoring rule)

$$S(p(\tilde{y}|y), y_i) = \log p(y_i|y)$$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- The log score (a local and proper scoring rule)

$$S(p(\tilde{y}|y), y_i) = \log p(y_i|y)$$

- The log predictive density (lpd)

$$\begin{aligned}\text{lpd} &= \log p(y|y) \\ &= \log \int p(y|\theta)p(\theta|y)d\theta\end{aligned}$$

- The lpd is usually approximated with the log **point** predictive density (lppd or just lpd)

$$\begin{aligned}\text{lppd} &= \sum_i^n \log p(y_i|y) \\ &\approx \log p(y|y)\end{aligned}$$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable

- Summary

Computed from 4000 by 20 log-likelihood matrix

	Estimate	SE
elpd_loo	-29.5	3.3
p_loo	2.7	1.0

Monte Carlo SE of elpd\_loo is 0.1.

Pareto k diagnostic values:

		Count	Pct.	Min.	n_eff
(-Inf, 0.5]	(good)	18	90.0%	899	
(0.5, 0.7]	(ok)	2	10.0%	459	
(0.7, 1]	(bad)	0	0.0%	<NA>	
(1, Inf)	(very bad)	0	0.0%	<NA>	

All Pareto k estimates are ok ( $k < 0.7$ ).  
See `help('pareto-k-diagnostic')` for details.

### When is LOO applicable

UPPSALA  
UNIVERSITET

# Pro and cons with LOO-CV

---

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- + Intuitive
- + Robust
- + Good theoretical properties

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- + Intuitive
- + Robust
- + Good theoretical properties
  - Can be costly (naive LOO-CV mean  $n$  posterior computations)

# Sometimes cross-validation is not needed

- Posterior predictive checking can be sufficient

Predicting the yields of mesquite bushes.

Gelman, Hill & Vehtari (2020, Ch. 11)

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable

  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Posterior predictive checking can be sufficient

Predicting the yields of mesquite bushes.

Gelman, Hill & Vehtari (2020, Ch. 11)

- In nested case, often easier and more accurate to analyse posterior distribution of more complex model directly

# Data generating mechanisms and prediction tasks

---

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. You have to make some assumptions on data generating mechanism  $p_{\text{true}}$

$$\text{elpd}_M = \int \log p_M(\tilde{y}|y) p_{\text{true}}(\tilde{y}) d\tilde{y},$$

2. Use the knowledge of the prediction task if available
3. Cross-validation can be used to analyse different parts, even if there is no clear prediction task

### Fixed / designed $x$

LOO is ok for fixed / designed  $x$ :  $p_{\text{true}}(y|x)$

## Recap: Importance sampling

### Draws and importance weights

$$E[f(\theta)] \approx \frac{\sum_s w_s f(\theta^{(s)})}{\sum_s w_s}, \quad \text{where} \quad w_s = \frac{q(\theta^{(s)})}{g(\theta^{(s)})}$$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - **PSIS LOO-CV**
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Let  $f = p(\tilde{y}_i|y_{-i})$ ,  $g = p(\theta|y)$ , and  $q = p(\theta|y_{-i})$

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Let  $f = p(\tilde{y}_i|y_{-i})$ ,  $g = p(\theta|y)$ , and  $q = p(\theta|y_{-i})$
- Having samples  $\theta^s$  from  $p(\theta^s|y)$

$$p(\tilde{y}_i|y_{-i}) \approx \frac{\sum_{s=1}^S p(\tilde{y}_i|\theta^s) w_i^s}{\sum_{s=1}^S w_i^s},$$

where  $w_i^s$  are importance weights and

$$w_i^s = \frac{p(\theta^s|y_{-i})}{p(\theta^s|y)}.$$

- We get a nice solution

$$w_i^s = \frac{p(\theta^s | y_{-i})}{p(\theta^s | y)} = \frac{\frac{p(\theta^s) \prod_{j \neq i} p(y_j | \theta^s)}{p(y_{-i})}}{\frac{p(\theta^s) \prod_j p(y_j | \theta^s)}{p(y)}} \propto \frac{1}{p(y_i | \theta^s)}.$$

- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- We get a nice solution

$$w_i^s = \frac{p(\theta^s | y_{-i})}{p(\theta^s | y)} = \frac{\frac{p(\theta^s) \prod_{j \neq i} p(y_j | \theta^s)}{p(y_{-i})}}{\frac{p(\theta^s) \prod_j p(y_j | \theta^s)}{p(y)}} \propto \frac{1}{p(y_i | \theta^s)}.$$

- If evaluated with  $\tilde{y}_i = y_i$

$$p(\tilde{y}_i | y_{-i}) \approx \frac{\sum_{s=1}^S p(\tilde{y}_i | \theta^s) w_i^s}{\sum_{s=1}^S w_i^s} = \frac{1}{\sum_{s=1}^S \frac{1}{p(y_i | \theta^s)}},$$

and

$$\log w_i^{(s)} = -\log p(y_i | \theta^{(s)})$$

# Arsenic well example – Model comparison

- Model assessment and selection

- Measures of predictive accuracy
- Model selection

- Cross-validation

- When is LOO applicable
- PSIS LOO-CV
- K-fold CV
- Model Comparison

- Information criteria

- Model averaging and Stacking

- Summary

```
> loo_compare(model1, model2)
      elpd_diff se_diff
model2      0.0      0.0
model1 -14.4      6.1
```

`se_diff` and normal approximation for the uncertainty in the difference is good only if models are well specified and the number of observations is relatively big.

# Watanabe Information Criteria

## 1. Watanabe information criteria

$$\text{elpd}_{\text{WAIC}} = \sum_i \log p(y_i|y) - p_{\text{WAIC}}$$

## 2. We estimate the number of efficient parameters with

$$p_{\text{WAIC1}} = 2 \sum_i^n (\log E_{p(\theta|y)}(p(y_i|\theta)) - E_{p(\theta|y)}(\log p(y_i|\theta)))$$

or

$$p_{\text{WAIC2}} = 2 \sum_i^n (V_{p(\theta|y)}(\log p(y_i|\theta)))$$

## 3. WAIC

$$\text{WAIC} = -2\text{elpd}_{\text{WAIC}}$$

## 4. WAIC can be seen as an approximation of the $\text{elpd}_{\text{loo}}$

UPPSALA  
UNIVERSITET

# WAIC vs PSIS-LOO

---

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. WAIC has same assumptions as LOO
2. PSIS-LOO is more accurate

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. WAIC has same assumptions as LOO
2. PSIS-LOO is more accurate
3. PSIS-LOO has much better diagnostics

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. WAIC has same assumptions as LOO
2. PSIS-LOO is more accurate
3. PSIS-LOO has much better diagnostics
4. LOO makes the prediction assumption more clear, which helps if K-fold-CV is needed instead

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. WAIC has same assumptions as LOO
2. PSIS-LOO is more accurate
3. PSIS-LOO has much better diagnostics
4. LOO makes the prediction assumption more clear, which helps if K-fold-CV is needed instead
5. Multiplying by -2 doesn't give any benefit (Watanabe didn't multiply by -2)

## Summary

# Take-home messages

---

- Model assessment and selection
  - Measures of predictive accuracy
  - Model selection
- Cross-validation
  - When is LOO applicable
  - PSIS LOO-CV
  - K-fold CV
  - Model Comparison
- Information criteria
- Model averaging and Stacking
- Summary

1. It's good to think predictions of observables, because observables are the only ones we can observe
2. Cross-validation can simulate predicting and observing new data
3. Cross-validation is good if you don't trust your model
4. Different variants of cross-validation are useful in different scenarios
